

# A Binder in every pot !!

Clear cost model  
(bounded, service level)  
Legal interoperability guidelines  
and UI ; explicitness  
Annotatable / reviewable (uniquely identifiable)

Shared values:

community  
governance  
Sharing outputs  
open, common  
inclusive, global  
sustainable  
trustworthy  
socially, technical

- Community governance?
- Distinction Binder vs. Jupyter
  - conference!
  - distinction: how, where, what

"Do gooders who want to share" →  
Reusability and reproducibility

Potential partners:

CyVerse / Jetstream

COS

hivario / Datarose

Ubiquity now with repos

Tim asks: why Zorodo?

- well integrated w/ ORE
- good defaults for metadata

Adoption:

- early adopters
- Training?
- again, clear "cost model"

Readings to progress:

- identify early infrastructure partners
- path to buy in for "community" (not specific campuses)
  - ↳ find early champions
- develop sustainability/buy in model so institutions can buy in
- can we interface with Corporates?  
(model for funding?)
